History of Development

-03/13/2017:

The FDM solver was written for DNS solution of Burgers' equation. The FDM scheme was Fourth order. The solution could not converge for low viscosity value.

-04/08/2017:

The second order FDM solver were tested on the program. The new scheme solved the problem that the code had regarding the instability in the calculation.

-04/21/2017:

The LES approach was added to the solver successfully. Also, the output function was added to the program.

-04/27/2017:

The software was made user-friendly. At this stage, the software allowed the users to set the viscosity and final time and input file.

-05/04/2017:

The user and developer documentations and instruction for installation were written.
